

Practical 1

A. A simple client class that generates the private and public keys by using the built-in Python RSA algorithm and test it.

Code:

```
import Crypto
import binascii
from Crypto.PublicKey import RSA
from Crypto.Signature import PKCS1_v1_5
class Client:
    def __init__(self):
        random = Crypto.Random.new().read

        self._private_key = RSA.generate(1024, random)
        self._public_key = self._private_key.publickey()
        self._signer = PKCS1_v1_5.new(self._private_key)

    @property
    def identity(self):
        return binascii.hexlify(self._public_key.exportKey(format='DER')).decode('ascii')

Shivam = Client()
print("\nPublic Key:",Shivam.identity)
```

Output:

```
C:\Users\schau\Music\blockchainprac>python client.py

Public Key: 30819f300d06092a864886f70d0101050003818d0030818902818100d83e162ba97c76a643921c6e88b65f322d9f832915d86bbb56

```

B. A transaction class to send and receive money and test it.

Code:

#1B.- A transaction class to send and receive money and test it.

```
import Crypto
import binascii
import datetime
import collections
from Crypto.PublicKey import RSA
from Crypto.Signature import PKCS1_v1_5
from Crypto.Hash import SHA
class Client:
    def __init__(self):
        random = Crypto.Random.new().read
        self._private_key = RSA.generate(1024, random)
        self._public_key = self._private_key.publickey()
        self._signer = PKCS1_v1_5.new(self._private_key)
```

```

@property
def identity(self):
    return binascii.hexlify(self._public_key.exportKey(format='DER')).decode('ascii')
class Transaction:
    def __init__(self, sender, receiver, value):
        self.sender = sender
        self.receiver = receiver
        self.value = value
        self.time = datetime.datetime.now()
    def to_dict(self):
        if self.sender == "Genesis":
            identity = "Genesis"
        else:
            identity = self.sender.identity
        return collections.OrderedDict({
            'sender': identity,
            'receiver': self.receiver,
            'value': self.value,
            'time': self.time
        })
    def sign_transaction(self):

```

D. Create a blockchain, a genesis block and execute it.

Code:

```

import Crypto
import binascii
import datetime
import collections
from Crypto.PublicKey import RSA
from Crypto import Random
from Crypto.Hash import SHA

```

```
from Crypto.Signature import PKCS1_v1_5
import hashlib
from hashlib import sha256
class Client:
    def __init__(self):

        random = Crypto.Random.new().read
        # Creating new public key and private key
        self._private_key = RSA.generate(1024, random)
        self._public_key = self._private_key.publickey()
        self._signer = PKCS1_v1_5.new(self._private_key)

    @property
    def identity(self):
        return binascii.hexlify(self._public_key.exportKey(format='DER')).decode('ascii')
class Transaction:
    def __init__(self, sender, receiver, value):
        self.sender = sender
        self.receiver = receiver
        self.value = value
        self.time = datetime.datetime.now()

    def to_dict(self):
        if self.sender == "Genesis":
            identity = "Genesis"
        else:
            identity = self.sender.identity

        return collections.OrderedDict({
            'sender': identity,
            'receiver': self.receiver,
            'value': self.value,
            'time': self.time
        })

    def sign_transaction(self):
        private_key = self.sender._private_key
        signer = PKCS1_v1_5.new(private_key)
        h = SHA.new(str(self.to_dict()).encode('utf8'))
        return binascii.hexlify(signer.sign(h)).decode('ascii')
class Block:
    def __init__(self):
        self.verified_transactions = []
        self.previous_block_hash = ""
        self.Nonce = ""

        last_block_hash = ""

    def display_transaction(transaction):
        dict = transaction.to_dict()
        print("Sender: " + dict['sender'])
```

```

    print('-----')
    print("Receiver: " + dict['receiver']) # Corrected typo
    print('-----')
    print("Value: " + str(dict['value']))
    print('-----')
    print("Time: " + str(dict['time']))
    print('-----')
Ninad = Client()
t0 = Transaction(
    "Genesis",
    Ninad.identity,
    500.0
)
block0 = Block()
block0.previous_block_hash = None
Nonce = None
block0.verified_transactions.append(t0)
digest = hash(block0)
last_block_hash = digest
TPCoins = []
def dump_blockchain(self):
    print("Number of blocks in chain: "+ str(len(self)))
    for x in range(len(TPCoins)):
        block_temp = TPCoins[x]
        print("block #" + str(x))
        for transaction in block_temp.verified_transactions:
            Block.display_transaction(transaction)
        print('-'*20)
    print("="*30)
TPCoins.append(block0)
dump_blockchain(TPCoins)

```

Output:

```

C:\Users\schau\Music\blockchainprac>python genesis-block
Number of blocks in chain: 1
block #0
Sender: Genesis
-----

```

E. Create a mining function and test it.**Code:**

```

import hashlib
def sha256(message):
    return hashlib.sha256(message.encode("ascii")).hexdigest()
def mine(message, difficulty=1):
    prefix = "1" * difficulty
    for i in range(1000):
        digest = hashlib.sha256(f"{message}{i}".encode()).hexdigest()

```

```

    if digest.startswith(prefix):
        print(f'after {str(i)} iterations found nonce: {digest}')
        break
mine("test message", 2)

```

Output:

```

C:\Users\schau\Music\blockchainprac>python Mining-function.py
after 52 iterations found nonce: 11f31955281b4afe3e769d508bb32cbac4f2f61689487710965aa2c609dff4bf

```

F. Add blocks to the miner and dump the blockchain.**Code:**

```

import datetime
import hashlib
# Create a class with two functions
class Block:
    def __init__(self, data, previous_hash):
        self.timestamp = datetime.datetime.now(datetime.timezone.utc)
        self.data = data
        self.previous_hash = previous_hash
        self.hash = self.calc_hash()
    def calc_hash(self):
        sha = hashlib.sha256()
        hash_str = self.data.encode("utf-8")
        sha.update(hash_str)
        return sha.hexdigest()
# Instantiate the class
blockchain = [Block("First block", "0")]
blockchain.append(Block("Second block", blockchain[0].hash))
blockchain.append(Block("Third block", blockchain[1].hash))
# Dumping the blockchain
for block in blockchain:
    print( f'Timestamp: {block.timestamp}\nData: {block.data}\nPrevious Hash:
{block.previous_hash}\nHash: {block.hash}\n" )

```

Output:

```

C:\Users\schau\Music\blockchainprac>python Add-Block.py
Timestamp: 2024-06-28 09:13:42.792874+00:00

Practical 2

Aim: Install and configure Go Ethereum and the Mist browser. Develop and test a sample application.(MetaMask & Remix)

Step 1-> Install MetaMask extension for chrome from Chrome Web Store.

Step 2-> Click on Metamask Extension in Extensions. Below page will open in a new tab. Click on Create a New Wallet. Click on I agree.

English

Let's get started

Trusted by millions, MetaMask is a secure wallet making the world of web3 accessible to all.

☒ I agree to MetaMask's [Terms of use](#)

Create a new wallet

Help us improve MetaMask

We'd like to gather basic usage and diagnostics data to improve MetaMask. Know that we never sell the data you provide here.

When we gather metrics, it will always be...

- ✓ **Private:** clicks and views on the app are stored, but other details (like your public address) are not.
- ✓ **General:** we temporarily use your IP address to detect a general location (like your country or region), but it's never stored.
- ✓ **Optional:** you decide if you want to share or delete your usage data via settings any time.

☐ We'll use this data to learn how you interact with our marketing communications. We may share relevant news (like product features).

We'll let you know if we decide to use this data for other purposes. You can review our [Privacy Policy](#) for more information. Remember, you can go to settings and opt out at any time.

I agree

No thanks

Step 3-> Create a password. This password can be used only on the device it was created on. Create a Strong password and click on Create a new Wallet button.

1

2

3

Create passwordSecure walletConfirm secret recovery phrase

Create password

This password will unlock your MetaMask wallet only on this device. MetaMask can not recover this password.

New password (8 characters min)

Create passwordSecure walletConfirm secret recovery phrase

Secure your wallet

Before getting started, watch this short video to learn about your Secret Recovery Phrase and how to keep your wallet safe.

0:00 / 1:35

Remind me later (not recommended)

Secure my wallet (recommended)

Step 4-> Click on Secure my wallet button, following window will appear.

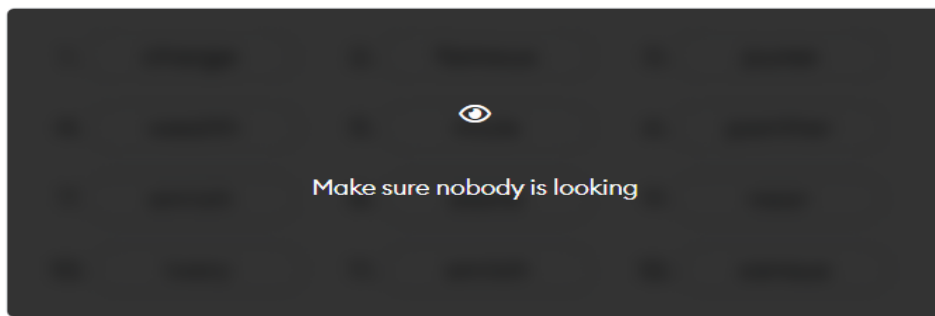

Write down your Secret Recovery Phrase

Write down this 12-word Secret Recovery Phrase and save it in a place that you trust and only you can access.

Tips:

- Save in a password manager
- Store in a safe deposit box
- Write down and store in multiple secret places

Reveal Secret Recovery Phrase

Step 5-> Click on Reveal Secret Recovery Phrase button and save the words in the same sequence.

Write down your Secret Recovery Phrase

Write down this 12-word Secret Recovery Phrase and save it in a place that you trust and only you can access.

Tips:

- Save in a password manager
- Store in a safe deposit box
- Write down and store in multiple secret places

1.	<input type="text"/>	2.	<input type="text"/>	3.	<input type="text"/>
4.	<input type="text"/>	5.	<input type="text"/>	6.	<input type="text"/>
7.	<input type="text"/>	8.	<input type="text"/>	9.	<input type="text"/>
10.	<input type="text"/>	11.	<input type="text"/>	12.	<input type="text"/>

Step 6-> Enter the respective words in the empty positions and click Confirm.

Confirm Secret Recovery Phrase

Confirm Secret Recovery Phrase

1. charge	2. famous	3. 
4. 	5. mule	6. panther
7. enrich	8. 	9. near
10. ivory	11. enrich	12. census

Confirm

Step 7-> Click Got it!

Wallet creation successful

You've successfully protected your wallet. Keep your Secret Recovery Phrase safe and secret -- it's your responsibility!

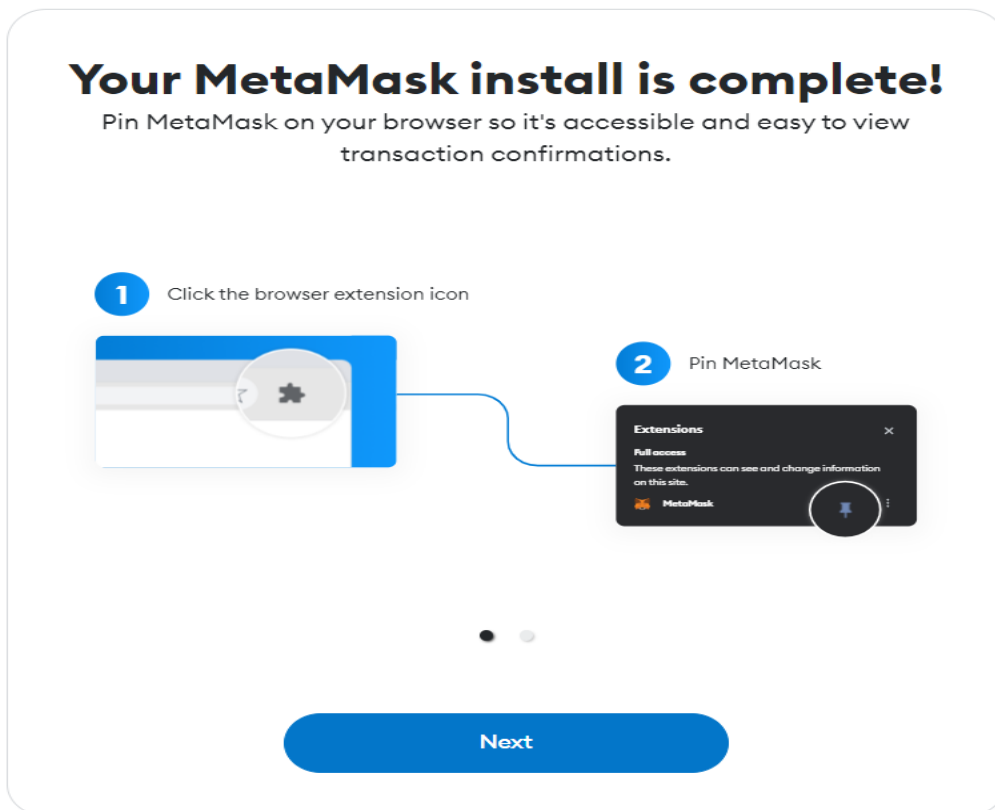

Remember:

- MetaMask can't recover your Secret Recovery Phrase.
- MetaMask will never ask you for your Secret Recovery Phrase.
- **Never share your Secret Recovery Phrase** with anyone or risk your funds being stolen
- [Learn more](#)

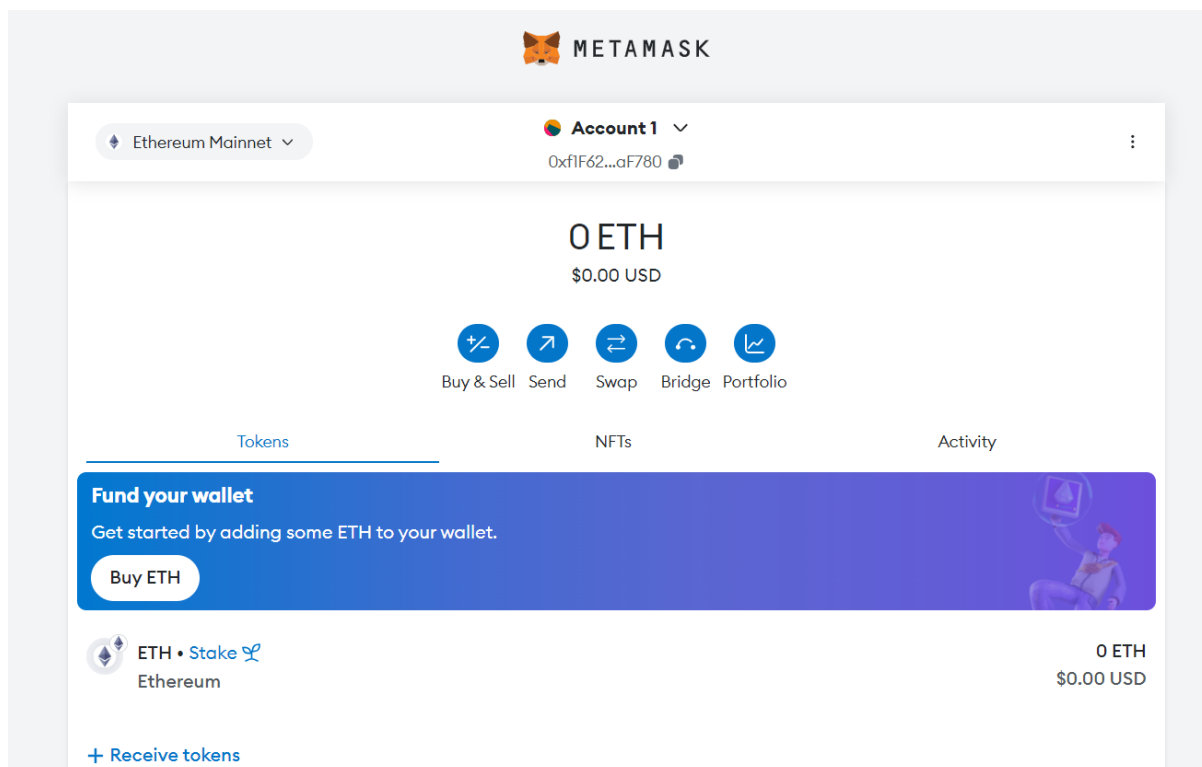

[Advanced configuration](#)

Got it

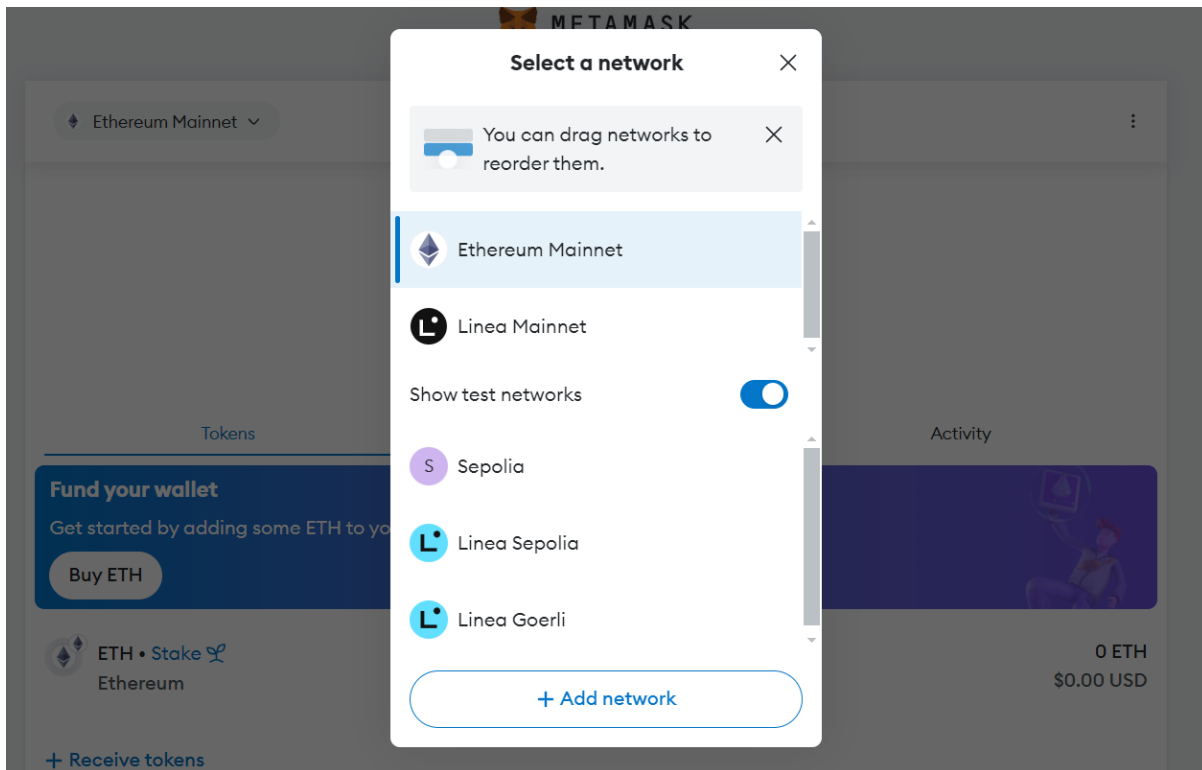

Step 8-> Click on Next

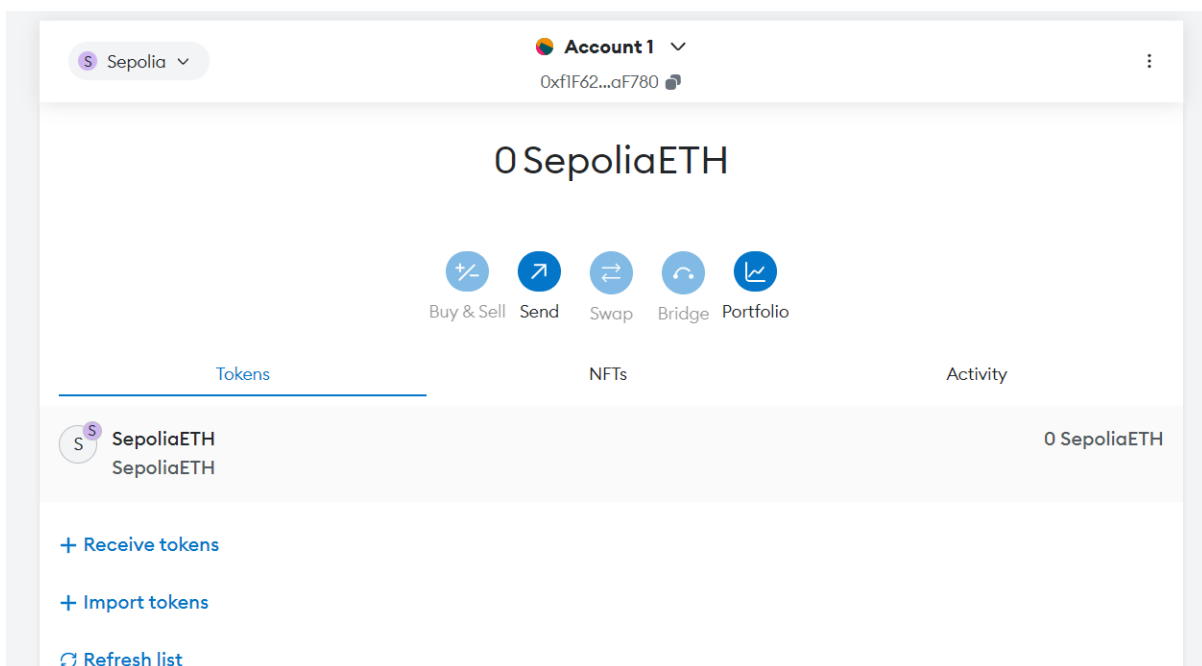

Step 9-> Following will be the Dashboard.

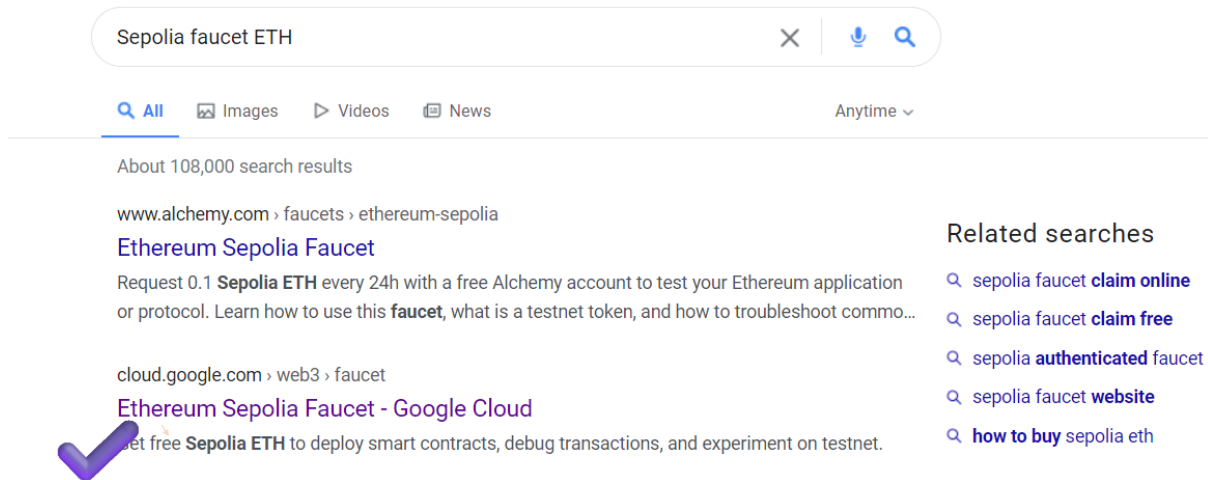

Step 10-> Click on Ethereum Mainnet button. Next click on Show/hide test networks.

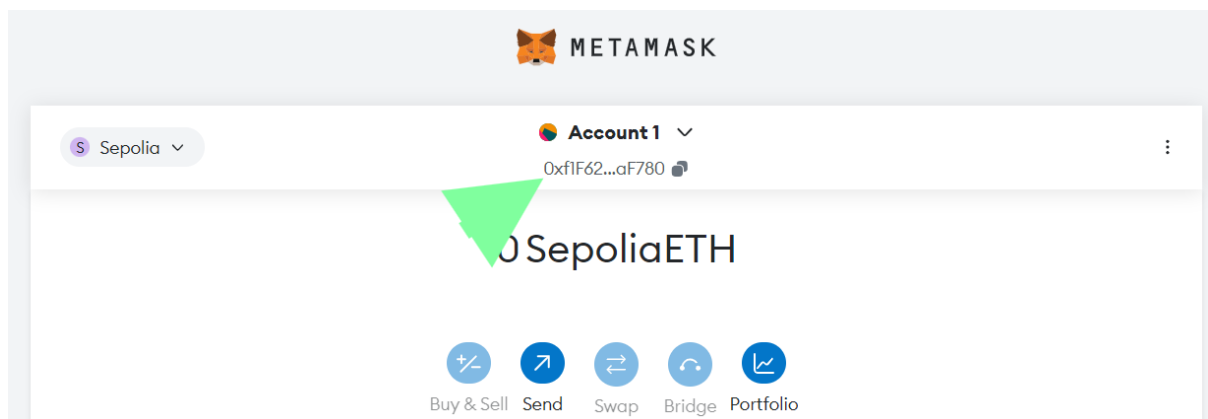

Step 11-> Check if tesnets are shown by clicking on Etherum Mainnet button. Click on Sepolia test network.

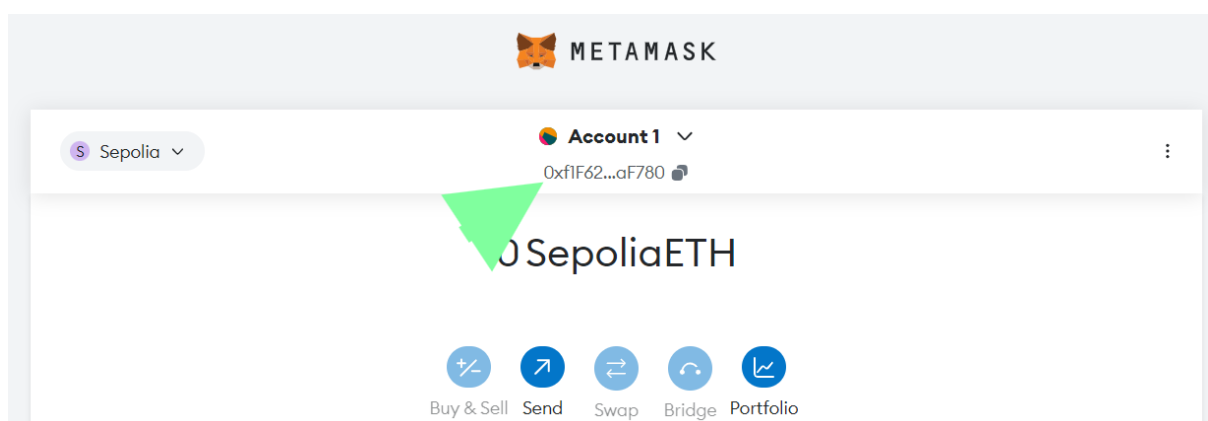

Step 12-> Go to <https://sepoliafaucet.com/> and Click on Alchemy Login button.

Step 13-> Now go to MetaMask and copy the account address.

Step 14-> Paste the address and click on Send Me ETH.

Step 16-> Your ETH transfer is successful.

Step 17-> Check your MetaMask account for Sepolia test network. 0.5 ETH will be added.

Practical 3

Aim: Implement and Demonstrate the use of the Following in Solidity.

1. TO EXECUTE SOLIDITY SCRIPTS GO TO ->[HTTPS://REMIX.ETHEREUM.ORG/](https://remix.ethereum.org/)
2. OPEN CONTRACTS FOLDER AND STARTING WRITING SCRIPTS. THE SCRIPTS ARE COMPILED USING SOLIDITY COMPILER.
3. THE FOLLOWING SCRIPTS WERE COMPILED USING 0.5.0+COMMIT.1D4F565A SOLIDITY COMPILER
4. DEPLOY THE SCRIPTS TO EXECUTE CODE

A) Variable, Operators, Loops, Decision Making, Strings, Arrays, Enums, Structs, Mappings, Conversions, Ether Units, Special Variables.

A. Variable:

```
1.  pragma solidity ^0.5.0;
2.  contract SolidityTest {
3.      uint storedData; // State variable
4.      constructor() public {
5.          storedData = 10;
6.      }
7.      function getResult() public view returns(uint){
8.          uint a = 1; // local variable
9.          uint b = 2;
10.         uint result = a + b;
11.         return storedData; //access the state variable
12.     }
13. }
```

Output:

B. String:

```
pragma solidity ^0.5.0;

contract SolidityTest {
    constructor() public{
    }
    function getResult() public view returns(string memory){
        uint a = 1;
        uint b = 2;
        uint result = a + b;
        return integerToString(result);
    }
}
```

```
function integerToString(uint _i) internal pure
    returns (string memory) {

    if (_i == 0) {
        return "0";
    }
    uint j = _i;
    uint len;

    while (j != 0) {
        len++;
        j /= 10;
    }
    bytes memory bstr = new bytes(len);
    uint k = len - 1;

    while (_i != 0) {
        bstr[k--] = byte(uint8(48 + _i % 10));
        _i /= 10;
    }
    return string(bstr);
}
```

Output:**C. Operators**

```
pragma solidity ^0.5.0;
contract SolidityTest {
    uint16 public a = 20;
    uint16 public b = 10;
    uint256 public sum = a + b;
    uint256 public diff = a - b;
    uint256 public mul = a * b;
    uint256 public div = a / b;
    uint256 public mod = a % b;
    uint256 public dec = --b;
    uint256 public inc = ++a;
}
```

Output:**D. Array****Code:**

```
pragma solidity ^0.5.0;

contract arraydemo {
    // Static Array
    uint[6] arr2 = [10, 20, 30];

    function dispstaticarray() public view returns (uint[6] memory) {
        return arr2;
    }

    // Dynamic Array
    uint x = 5;
    uint[] arr1;
```

```
constructor() public {  
    while (x > 0) {  
        arr1.push(x);  
        x = x - 1;  
    }  
}  
  
function dispdynamicarray() public view returns (uint[] memory) {  
    return arr1;  
}  
}
```

Output:**E. Decision Making:****Code:**

```
pragma solidity ^0.5.0;  
  
contract ifelsedemo {  
    uint i = 10;  
  
    function decision_making() public view returns (string memory) {  
        if (i % 2 == 0) {  
            return "even";  
        } else {  
            return "Odd";  
        }  
    }  
}
```

Output:**F. Loop:****Code:**

```
pragma solidity ^0.5.0;

contract loopDemo {
    uint[] data;

    function forDemo() public returns (uint[] memory) {
        for (uint i = 0; i < 10; i++) {
            data.push(i);
        }
        return data;
    }

    function disp() public view returns (uint[] memory) {
        return data;
    }
}
```

Output:**G. While Loop****Code:**

```
pragma solidity ^0.5.0;

contract whiledemo {
    uint[] data;
```

```
uint x = 0;

function whileLoopDemo() public {
    while(x < 5) {
        data.push(x);
        x = x + 1;
    }
}

function dispwhileloop() public view returns(uint[] memory) {
    return data;
}
}
```

Output:**H. Do While Loop:**

```
pragma solidity ^0.5.0;

// Creating a contract
contract DoWhile {
    // Declaring a dynamic array
    uint256[] data;
    // Declaring state variable
    uint8 j = 0;

    // Defining function to demonstrate 'Do-While loop'
    function loop() public returns (uint256[] memory) {
        do {
            j++;
            data.push(j);
        } while (j < 5);
        return data;
    }

    // Function to display the data array (view function)
    function display() public view returns(uint256[] memory) {
        return data;
    }
}
```

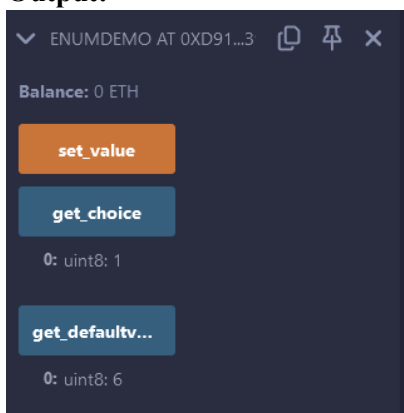

```
}  
}
```

Output:**I. Enums:****Code:**

```
pragma solidity ^0.5.0;  
  
contract enumdemo {  
    // Define the enum for week days  
    enum week_days {  
        Monday,  
        Tuesday,

8. Function Modifiers:

Code:

```
// SPDX-License-Identifier: MIT
pragma solidity ^0.5.0;

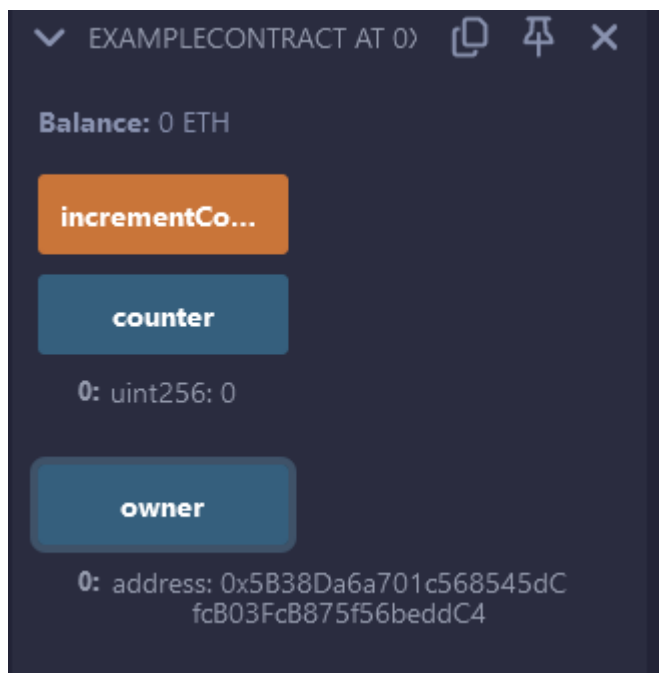

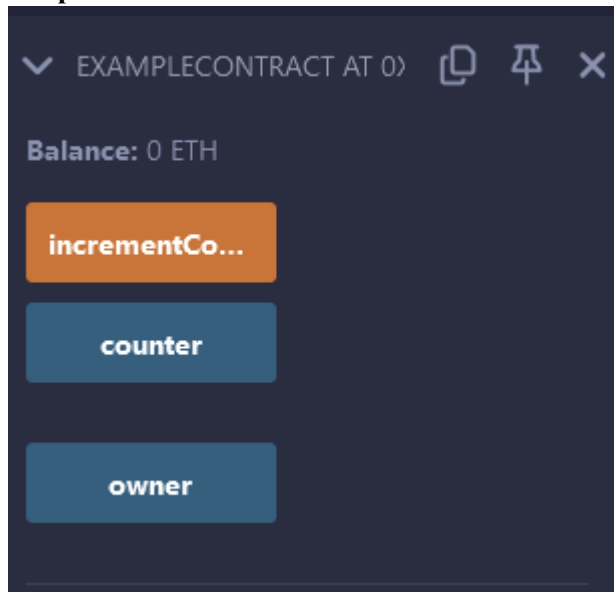

contract ExampleContract {
    address public owner = 0x5B38Da6a701c568545dCfcB03FcB875f56beddC4;
    uint256 public counter;

    modifier onlyOwner() {
        require(msg.sender == owner, "Only the contract owner can call");
        _;
    }

    function incrementCounter() public onlyOwner {
```

```
        counter++;  
    }  
}
```

Output:

As we click on Increment Button it will Increment One by One.

Practical 4

Aim: Implement and Demonstrate the use of then following in solidity.

A. Withdrawal Pattern, Restricted Access.

Code:

```
1.      Withdrawal Pattern.
2.      // SPDX-License-Identifier: MIT
3.      pragma solidity 0.8.18;
4.
5.      contract WithdrawalPattern {
6.          address public owner;
7.          uint256 public lockedBalance;
8.          uint256 public withdrawableBalance;
9.
10.         constructor() {
11.             owner = msg.sender;
12.         }
13.
14.         modifier onlyOwner() {
15.             require(msg.sender == owner, "Only the owner can call this function");
16.             _;
17.         }
18.
19.         function deposit(uint256 amount) public payable {
20.             require(amount > 0, "Amount must be greater than zero");
21.             lockedBalance += amount;
22.         }
23.
24.         function withdraw(uint256 amount) public onlyOwner {
25.             require(amount <= withdrawableBalance, "Insufficient withdrawable balance");
26.             withdrawableBalance -= amount;
27.             payable(msg.sender).transfer(amount);
28.         }
29.
30.         function unlock(uint256 amount) public onlyOwner {
31.             require(amount <= lockedBalance, "Insufficient locked balance");
32.             lockedBalance -= amount;
33.             withdrawableBalance += amount;
34.         }
35.     }
```

Output:

2. Restricted Access

Code:

```
// SPDX-License-Identifier: MIT
pragma solidity ^0.8.18;

contract RestrictedAccess {
    address public owner = msg.sender;
    uint256 public creationTime = block.timestamp;

    modifier onlyBy(address _account) {
        require(msg.sender == _account, "Sender not authorized!");
        _;
    }

    modifier onlyAfter(uint256 _time) {
        require(block.timestamp >= _time, "Function was called too early!");
        _;
    }

    modifier costs(uint256 _amount) {
        require(msg.value >= _amount, "Not enough Ether provided!");
        _;
    }

    function forceOwnerChange(address _newOwner)
        public
        payable
        costs(200 ether)
    {
        owner = _newOwner;
    }

    function changeOwner(address _owner) public onlyBy(owner) {
        owner = _owner;
    }

    function disown() public onlyBy(owner) onlyAfter(creationTime + 3 weeks) {
        delete owner;
    }
}

/*Last owner address:
0:
address: 0x5B38Da6a701c568545dCfcB03FcB875f56beddC4 */
```

Output:

In this we change the owner address and Input New Owner Address.
Then Click the owner tab to get Last owner address.

B. Contracts, Inheritance, Constructors, Abstract Contracts, Interfaces

1. Contracts

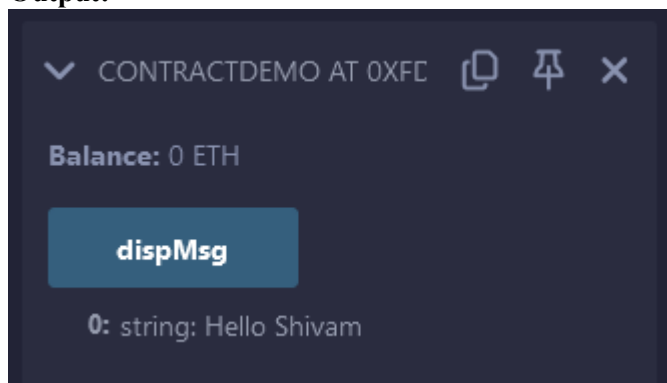

Code:

```
pragma solidity ^0.5.0;

contract ContractDemo {
    string message = "Hello Shivam";

    function dispMsg() public view returns (string memory) {
        return message;
    }
}
```

Output:

2. Inheritance

Code:

```
pragma solidity >=0.4.22 <0.6.0;

contract Parent {
    uint256 internal sum;

    function setValue() external {
        uint256 a = 10;
        uint256 b = 20;
        sum = a + b;
    }
}

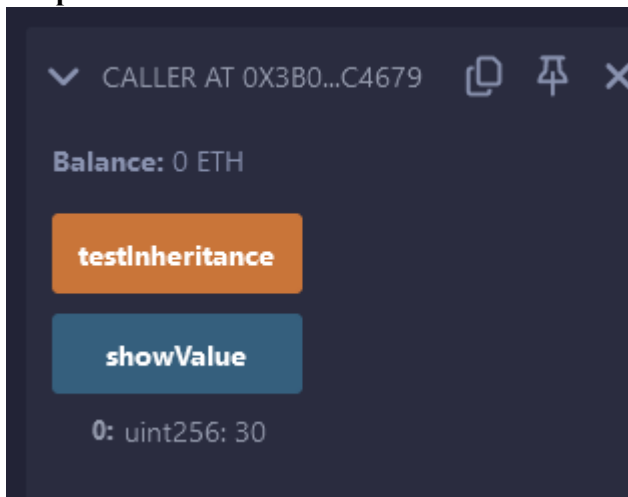

contract Child is Parent {
    function getValue() external view returns (uint256) {
        return sum;
    }
}

contract Caller {
    Child cc = new Child();
}
```

```
function testInheritance() public returns (uint256) {
    cc.setValue();
    return cc.getValue();
}

function showValue() public view returns (uint256) {
    return cc.getValue();
}
}
```

Output:

3. Abstract Access.

Code:

```
// SPDX-License-Identifier: MIT
pragma solidity ^0.5.17;

contract Calculator {
    function getResult() external view returns (uint256);
}

contract Test is Calculator {
    constructor() public {}

    function getResult() external view returns (uint256) {
        uint256 a = 1;
        uint256 b = 2;
        uint256 result = a + b;
        return result;
    }
}
```

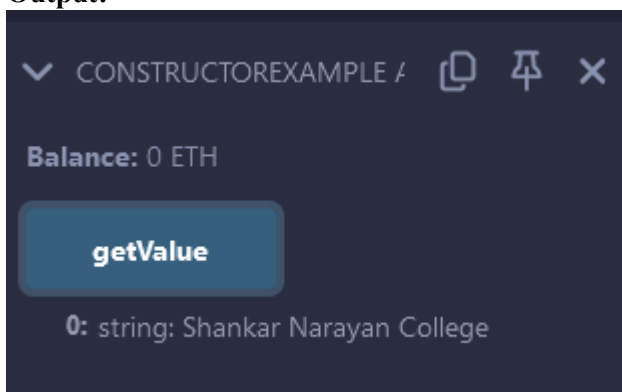

Output:**4. Constructor:****Code:**

```
// SPDX-License-Identifier: MIT
pragma solidity ^0.5.0;

// Creating a contract
contract constructorExample {
    string str;

    constructor() public {
        str = "Shankar Narayan College";
    }

    function getValue() public view returns (string memory) {
        return str;
    }
}
```

Output:**5.Interfaces:****Code:**

```
pragma solidity ^0.5.0;

interface Calculator {
    function getResult() external view returns (uint);
}
```

```
}  
  
contract Test is Calculator {  
    constructor() public {}  
  
    function getResult() external view returns (uint) {  
        uint a = 1;  
        uint b = 2;  
        uint result = a + b;  
        return result;  
    }  
}
```

Output:

C. Libraries, Assembly, Events, Error handling.

1) Libraries:

a. My Math lab Libraries:

Code:

```
// SPDX-License-Identifier: MIT  
pragma solidity >=0.7.0 <0.9.0;

        // require(sum < 255, "Invalid");
        assert(sum < 255);
        return sum;
    }
}
```

Output:

Practical No: 6

Aim: Demonstrate the running of the blockchain node.

Step 1-> Create a folder named ethermine and a JSON file named genesis.json and write the following lines in it.

Genesis.json

```
{  
  "config": {  
    "chainId": 987,  
    "homesteadBlock": 0,  
    "eip150Block": 0,  
    "eip155Block": 0,  
    "eip158Block": 0  
  },  
  "difficulty": "0x400",  
  "gasLimit": "0x8000000",  
  "alloc": {}  
}
```

Step 2-> Run command `geth account new --datadir`

`C:\Users\Achsah\Documents\MScIT\sem4\blockchain_practical\ethermine`

`testnet-blockchain.`

```
C:\Users\Achsah>geth account new --datadir C:\Users\Achsah\Documents\MScIT\sem4\blockchain_practical\ethermine
INFO [04-20|20:03:09.337] Maximum peer count          ETH=50 LES=0 total=50

Practical 7

Aim: Create your own blockchain and demonstrate its use.

Note: Make Sure you have Installed node.js in their System.

Code:

```
// npm install crypto-js
const SHA256=require("crypto-js/sha256");
class Block{
  constructor(index,timestamp,data,previousHash=""){
    this.index=index;
    this.timestamp=timestamp;
    this.data=data;
    this.previousHash=previousHash;
    this.hash=this.calculateHash();
  }
  calculateHash(){
    return SHA256(
      this.index+
      this.previousHash+
      this.timestamp+
      JSON.stringify(this.data)
    ).toString();
  }
}
class Blockchain{
  constructor(){
    this.chain=[this.createGenesisBlock()];
  }
  createGenesisBlock(){
    return new Block(0,"09/06/2024","GenesisBlock","0");
  }
  getLatestBlock(){
    return this.chain[this.chain.length-1];
  }
  addBlock(newBlock){
    newBlock.previousHash=this.getLatestBlock().hash;
    newBlock.hash=newBlock.calculateHash();
    this.chain.push(newBlock);
  }
  isChainValid(){
    for(let i=1;i<this.chain.length;i++){
      const currentBlock = this.chain[i];
      const previousBlock = this.chain[i-1];
      if(currentBlock.hash !== currentBlock.calculateHash()){
        return false;
      }
      if(currentBlock.previousHash !== previousBlock.hash){
        return false;
      }
    }
  }
}
```

```
}  
}  
return true;  
}  
}  
//BlockchainImplementation  
let myCoin=new Blockchain();  
myCoin.addBlock(new Block(1,"09/06/2024",{amount:4}));  
myCoin.addBlock(new Block(2,"09/06/2024",{amount:8}));  
// console.log('Isblockchainvalid?'+myCoin.isChainValid());  
console.log(JSON.stringify(myCoin,null,4))
```

Output:

```
C:\Users\schau\Music\Blockchain Practicals>node main.js
